make the sandbox and start its workload

```
openshell sandbox create
```

ask the gateway to create a sandbox

```
--name cyberbird
```

its name; later commands refer to it

```
--from cyberbird:1
```

the image with Cyberbird inside

```
--detach
```

start the workload without attaching to it

```
--policy cyberbird-policy.yaml
```

the policy document: what it may read, write and reach

```
--no-auto-providers
```

never create providers from local keys

```
-- sleep infinity
```

the workload's command: it only keeps the sandbox alive

printed (excerpt)

```
Created sandbox: cyberbird
[0.1s] Starting sandbox Container created
```
